

sinmuERP.

What is sinmu_ERP

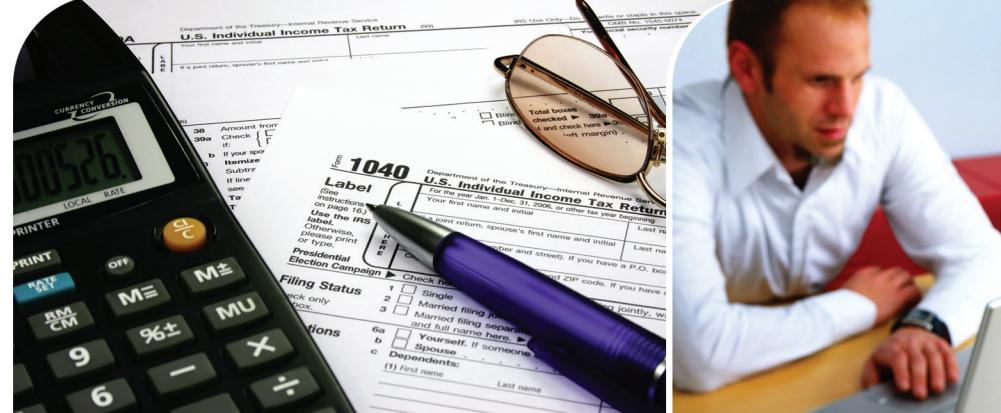

Enterprise resource planning (ERP) is an integrated computer-based system used to manage internal and external resources including tangible assets, financial resources, materials, and human resources. It is a software architecture whose purpose is to facilitate the flow of information between all business functions inside the boundaries of the organization and manage the connections to outside stakeholders. Built on a centralized database and normally utilizing a common computing platform, ERP systems consolidate all business operations into a uniform and enterprise wide system environment.

Only Together we create special solutions for your Business

Our Know-How

An ERP system can reside on a centralized server or be distributed across modular hardware and software units that provide "services" and communicate on a local area network or internet (online). The distributed design allows a business to assemble modules from different vendors without the need for the placement of multiple copies of complex, expensive computer systems in areas which will not use their full capacity.

Sinmu ERP is designed to integrate and operate in real-time with no periodic batch updates and all applications can access to one database to prevent redundant data and multiple data definitions. Users are able to access any information in the system to increase productivity and enhance integration on the day to day business operations.

Select Customise Modules

- Accounting
- Inventory Control management
- Sales, invoicing & Quotation
- CRM (customer relationship management)
- HRM (Human Resource Management)

Best Business Solutions

& Fresh Ideas for Your Success!

Perspective Development

ERP systems are cross-functional and enterprise-wide. All functional departments that are involved in operations or production are integrated in one system. In addition to areas such as manufacturing, warehousing, logistics, and information technology, this typically includes accounting, human resources, marketing and strategic management.

ERP II, in today's business world, is often used to describe what would be the next generation of ERP software. This new generation of software is web-based and allows both employees and external resources (such as suppliers and customers) real-time access to the system's data.

The "Best Practices" are what we deems as the most efficient way to carry out a particular business process in an Integrated Enterprise-Wide system. Sinmu Design employed a series of ERP implementation process which include Consultation, Initial feasible study, Analysis, Planning, Customization process, testing, implementation stage, training and maintainence support.

We emphasize on long-term support maintainence and we address our cusotmer's needs issue on our total software customization process. Hence, we differentiate our software development philosophy that cater different requirement for our customers at different level of complexity.
